

Delay-Tolerant Networking: *Architecture & Applications*

Kevin Fall

Intel Research, Berkeley

kfall@intel.com

<http://WWW.DTNRG.ORG>

Nov 23, 2004 / Riverside, CA

Outline

- *Why the Internet Architecture is not a ‘one-size-fits-all’ solution*
- *DTN Architecture Overview*
- *Applications & Recent Implementation Work*

RFC1149 : A Challenged Internet

- “...encapsulation of IP datagrams in avian carriers” (i.e. birds, esp carrier pigeons)
- Delivery of datagram:
 - Printed on scroll of paper in hexadecimal
 - Paper affixed to AC by duct tape
 - On receipt, process is reversed, paper is scanned in via OCR

Implementation of RFC1149

CPIP: Carrier Pigeon
Internet Protocol

- See <http://www.blug.linux.no/rfc1149/>

Ping Results

Script started on Sat Apr 28 11:24:09 2001

vegard@gyversalen:~\$ /sbin/ifconfig tun0

```
tun0      Link encap:Point-to-Point Protocol
          inet addr:10.0.3.2  P-t-P:10.0.3.1  Mask:255.255.255.255
          UP POINTOPOINT RUNNING NOARP MULTICAST  MTU:150  Metric:1
          RX packets:1 errors:0 dropped:0 overruns:0 frame:0
          TX packets:2 errors:0 dropped:0 overruns:0 carrier:0
          collisions:0
          RX bytes:8192 (8.0 kb) TX bytes:168 (1.6 kb)
```

vegard@gyversalen:~\$ ping 10.0.3.1

```
PING 10.0.3.1 (10.0.3.1): 56 data bytes
64 bytes from 10.0.3.1: icmp_seq=0 ttl=255 time=6165731.1 ms
64 bytes from 10.0.3.1: icmp_seq=4 ttl=255 time=3211900.8 ms
64 bytes from 10.0.3.1: icmp_seq=2 ttl=255 time=5124922.8 ms
64 bytes from 10.0.3.1: icmp_seq=1 ttl=255 time=6388671.9 ms
```

--- 10.0.3.1 ping statistics ---

```
9 packets transmitted, 4 packets received, 55% packet loss
round-trip min/avg/max = 3211900.8/5222806.6/6388671.9 ms
vegard@gyversalen:~$ exit
```

About 1.5 Hrs

High Loss

Unstated Internet Assumptions

- End-to-end RTT is not terribly large
 - A few seconds at the very most [typ < 500ms]
 - (window-based flow/congestion control works)
- Some path exists between endpoints
 - Routing usually finds single “best” existing route
 - [ECMP is an exception]
- E2E Reliability using ARQ works well
 - True for low loss rates (under 2% or so)
- Packet switching is the right abstraction
 - Internet/IP makes packet switching interoperable

Non-Internet-Like Networks

- Stochastic and periodic mobility
 - Military/tactical networks
 - Mobile routers w/disconnection (e.g. ZebraNet)
 - Spacecraft communications (LEO sats)
 - Busses, mail trucks, delivery trucks, etc. (InfoStations)
- “Exotic” links
 - Deep space [Mars: 40 min RTT; episodic connectivity]
 - Underwater [acoustics: low capacity, high error rates & latencies]
 - Sensor networks, mules

DTN challenges...

- Intermittent/Scheduled/Opportunistic Links
 - Scheduled transfers can save power and help congestion; scheduling common for esoteric links
- High Link Error Rates / Low Capacity
 - RF noise, light or acoustic interference, LPI/LPD concerns
- Very Large Delays
 - Natural prop delay could be seconds to minutes
 - If disconnected, may be (effectively) much longer
- Different Network Architectures
 - Many specialized networks won't/can't ever run IP

What to Do?

- Some problems surmountable using Internet/IP
 - ‘cover up’ the link problems using PEPs
 - Mostly used at “edges,” not so much for transit
- Performance Enhancing Proxies (PEPs):
 - Do “something” in the data stream causing endpoint (TCP/IP) systems to not notice there are problems
 - Lots of issues with transparency– security, operation with asymmetric routing, etc.
- Some environments *never* have an e2e path
 - Consider an approach tolerating disconnection, etc...

Delay-Tolerant Networking Architecture

- Goals
 - Support interoperability across ‘radically heterogeneous’ networks
 - Acceptable performance in high loss/delay/error/disconnected environments
 - Decent performance for low loss/delay/errors
- Components
 - Flexible naming scheme with *late binding*
 - Message overlay abstraction and API
 - Routing and link/contact scheduling w/CoS
 - Per-(overlay)-hop reliability and authentication

Naming

- Support ‘radical heterogeneity’ using *regions*:
 - Instance of an internet, not so radical inside a region
 - Common naming and protocol conventions
- Endpoint Name: ordered name pair $\{\mathbf{R}, \mathbf{L}\}$
 - \mathbf{R} : routing region [globally valid]
 - \mathbf{L} : region-specific, opaque outside region \mathbf{R}
- **Late binding** of \mathbf{L} permits naming flexibility:
 - \mathbf{L} used only in destination region of interest \mathbf{R}
 - Could be associative or location-oriented names [URN vs URL]
 - May encompass esoteric routing [e.g. diffusion]
 - Perhaps an Internet-style URI [see RFC2396]
- *To do*: make \mathbf{R}, \mathbf{L} compressible in transit networks

Message Overlay Abstraction

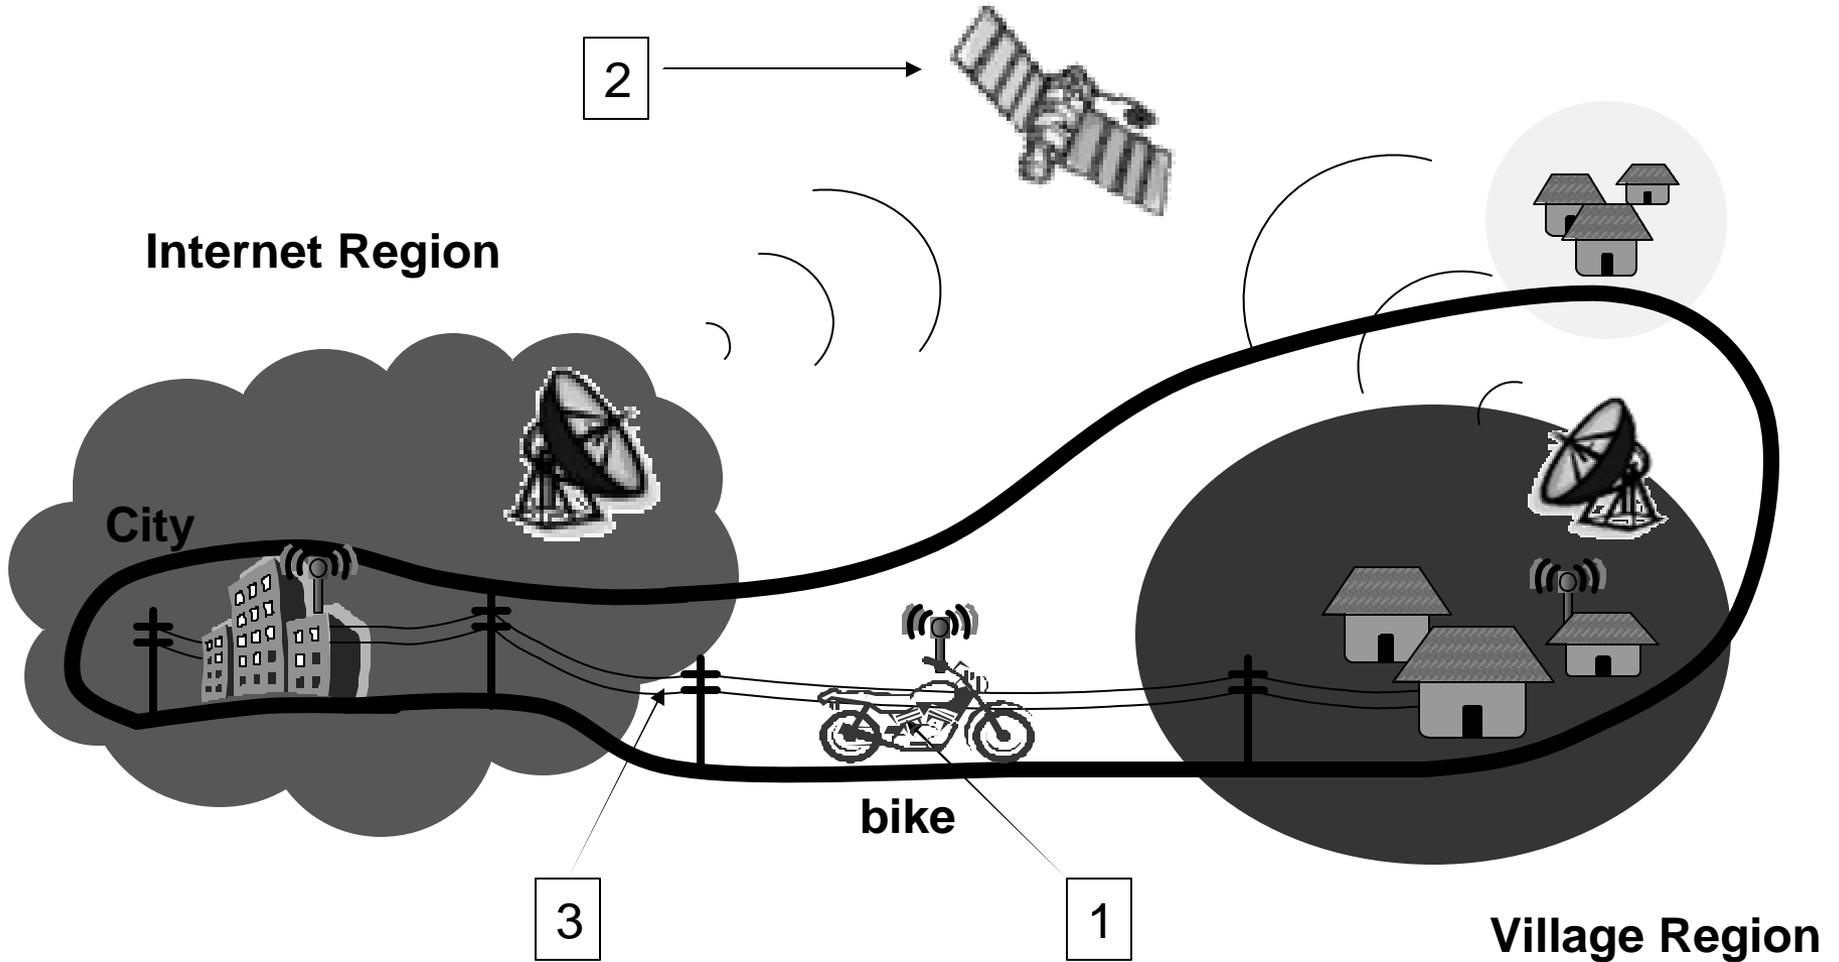

- E2E Async Message Service: “Bundles”
 - “postal-like” message delivery over regional transports with coarse-grained CoS [4 classes]
 - *Options*: return receipt, “traceroute”-like function, alternative reply-to field, custody transfer
 - Supportable on nearly any type of network
- Applications send/receive messages
 - “Application data units” of possibly-large size
 - May require framing above some transport protocols
 - API supports response processing long after request was sent (application *re-animation*)

So, is this just e-mail?

	naming/ late binding	routing	flow contrl	multi- app	security	reliable delivery	priority
e-mail	Y	N	N(Y)	N(Y)	opt	Y	N(Y)
DTN	Y	Y	Y	Y	opt	opt	Y

- Many similarities to (abstract) e-mail service
- Primary difference involves routing/restart and API
- E-mail depends on an underlying layer's routing:
 - Cannot generally move messages closer to their destinations in a partitioned network
 - In the Internet (SMTP) case, not disconnection-tolerant or efficient for long RTTs due to “chattiness”
- E-mail security authenticates only user-to-user

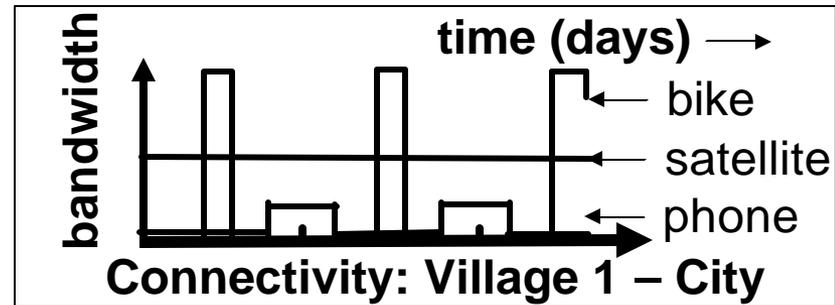

Example Routing Problem

Example Graph Abstraction

- bike (data mule)**
intermittent high capacity
- Geo satellite**
medium/low capacity
- dial-up link**
low capacity

Routing on Dynamic Graphs

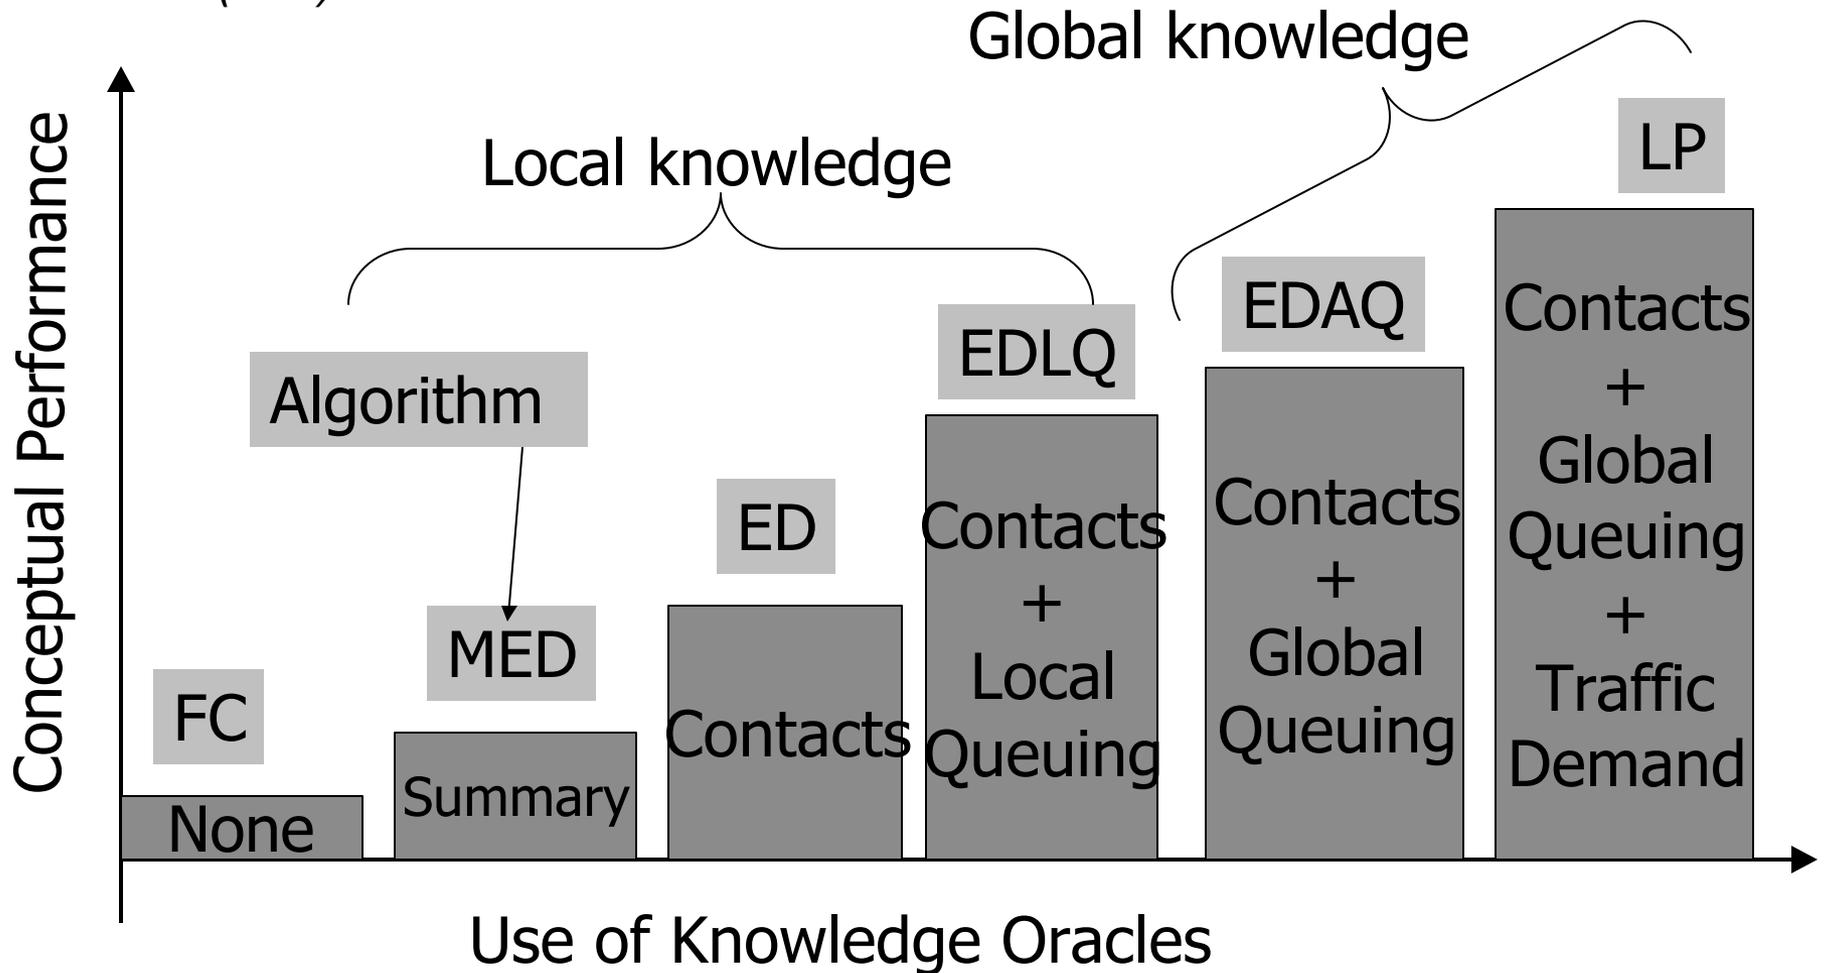

- DTN routing takes place on a time-varying topology
 - Links come and go, sometimes predictably
 - Use any/all links that can possibly help
- Scheduled, Predicted, or Unscheduled Links
 - May be direction specific [e.g. ISP dialup]
 - May learn from history to predict schedule
- Messages fragmented based on dynamics
 - Proactive fragmentation: optimize contact volume
 - Reactive fragmentation: resume where you failed
 - Both are important for high utilization of precious link resources

The DTN Routing Problem

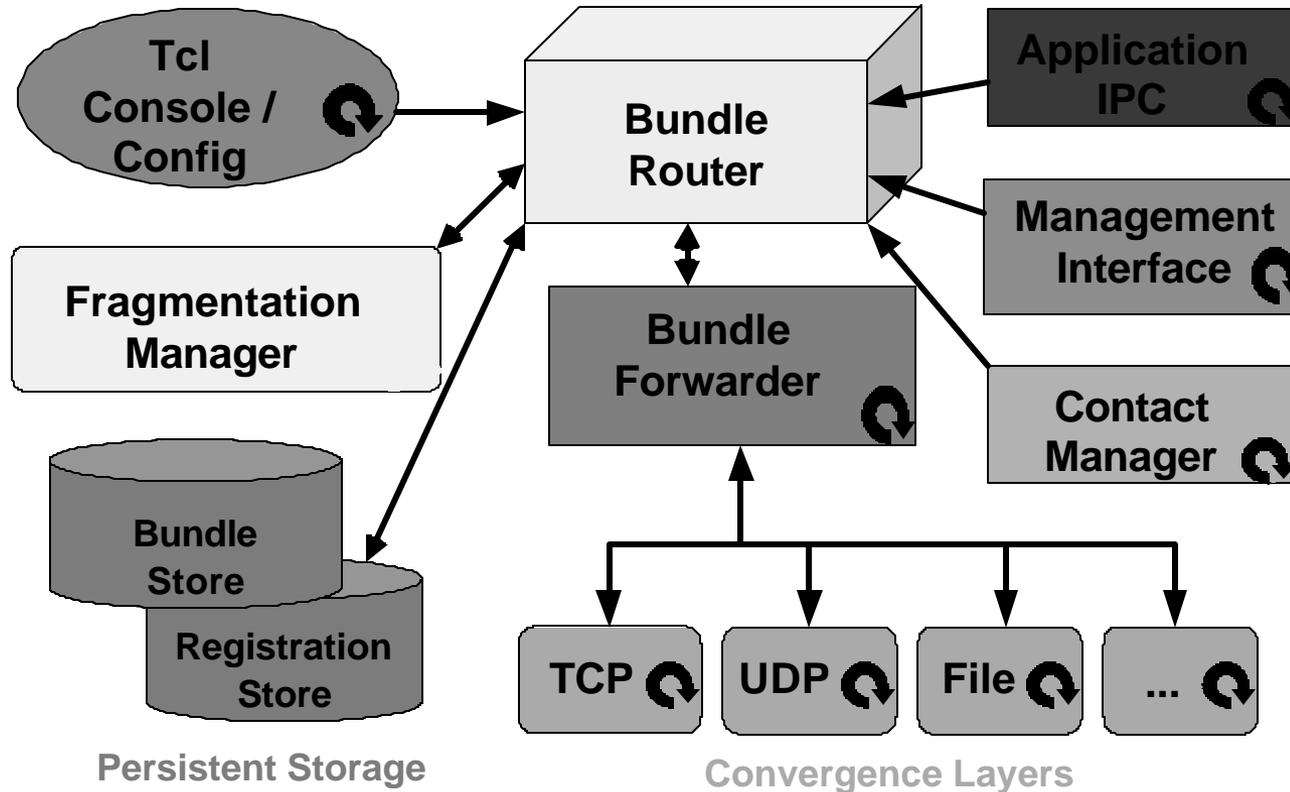

- *Inputs*: topology (multi)graph, vertex buffer limits, contact set, message demand matrix (w/priorities)
- An **edge** is a possible opportunity to communicate:
 - One-way: $(S, D, c(t), d(t))$
 - (S, D) : source/destination ordered pair of contact
 - $c(t)$: capacity (rate); $d(t)$: delay
 - A **Contact** is when $c(t) > 0$ for some period $[i_k, i_{k+1}]$
- Vertices have buffer limits; edges in graph if ever in any contact, multigraph for multiple physical connections
- *Problem*: optimize some metric of delivery on this structure
 - Sub-question: what metric to optimize?

Knowledge vs Performance

S. Jain (UW): SIGCOMM 2004

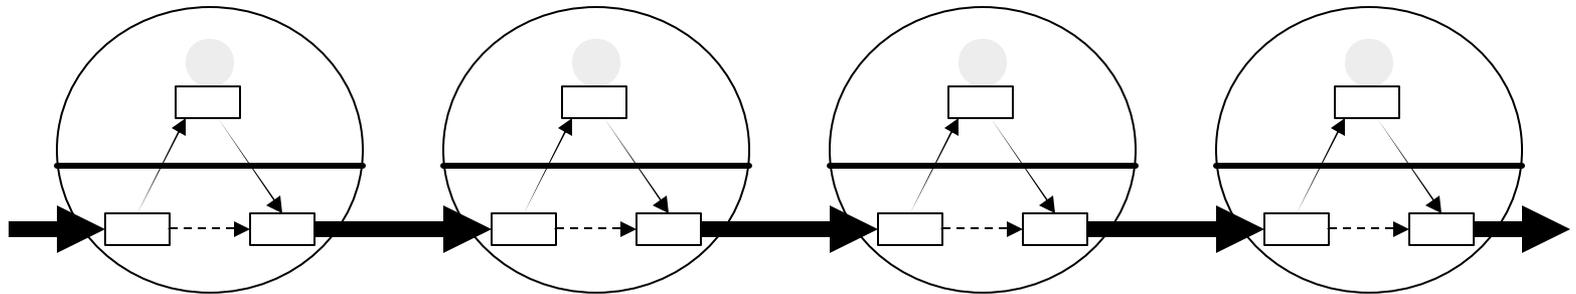

'DTN2' Implementation

Experiment Setup

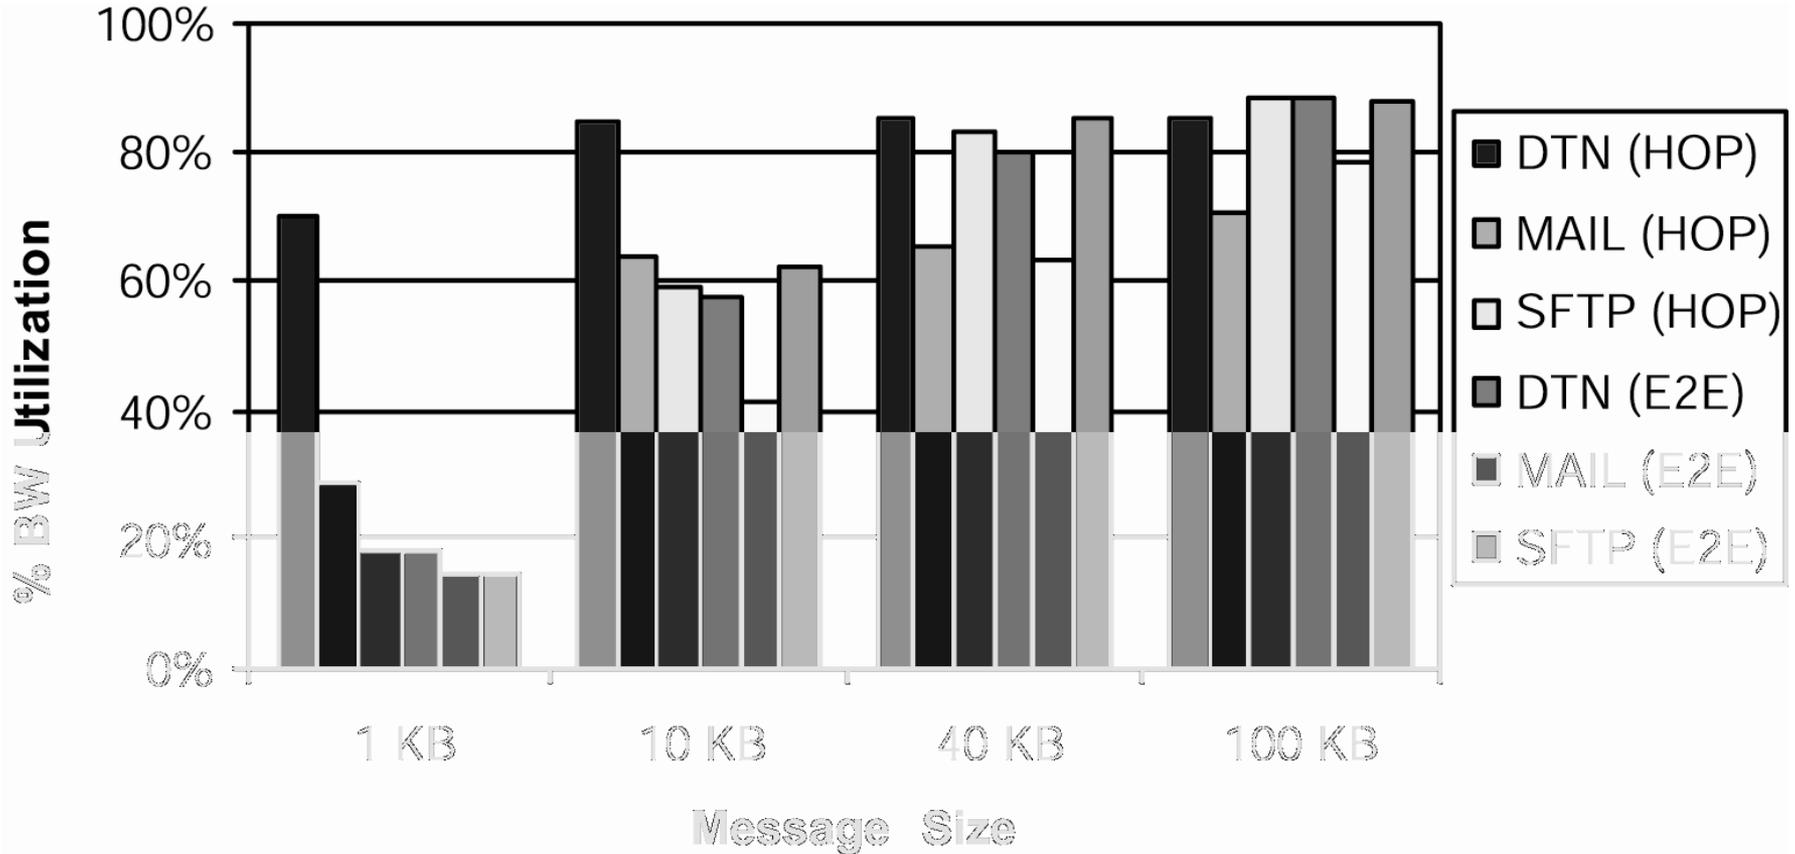

-----> E2E

-----> HOP

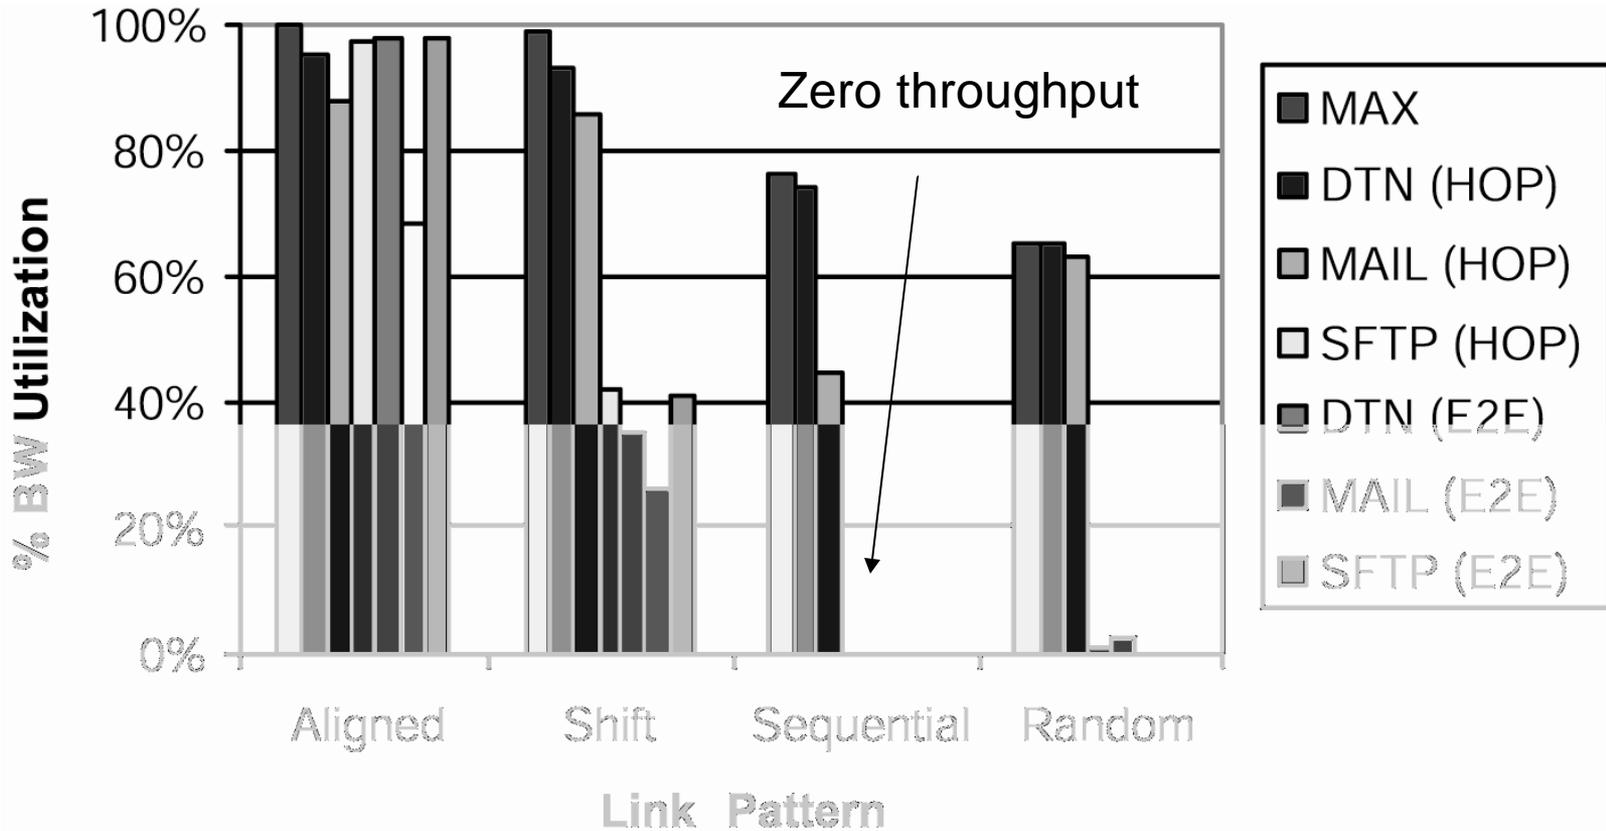

- Compare robustness to interruption / link errors
- Approaches compared
 - End-to-end TCP (kernel routing)
 - Proxied (TCP ‘plug proxies’)
 - Store-and-forward (Sendmail, no ckpoint/restart)
 - DTN (store-and-forward with restart)
- Link up/down patterns: aligned, shifted, sequential, random

BW Efficiency

No disruptions: DTN does well for small msgs, modest overhead overall

Interruption Tolerance

Up/down 1m/3min; 40kb messages; shift: 10s

Conclusions

- DTN foundational concepts appear to have wide applicability
- DTN Routing is a rich and challenging problem
- Reference implementation can be tricky
- Early performance results suggest our approach to disruption tolerance is effective

Status

- IETF/IRTF DTNRG formed end of 2002
 - See <http://www.dtnrg.org>
- DTN1 Agent Source code released 3/2003
- SIGCOMM Papers: 2003 [arch], 2004 [routing]
- Several other documents (currently ID's):
 - DTNRG Architecture document
 - Bundle specification
 - Application of DTN in the IPN
- Basis for new DARPA DTN program
- Part of NSF 'ICT4B' Project (with UCB)

On to an application...

ICT for Billions (ICT4B)

- Information and Communication Technologies for Developing Regions of the World
- Networking focus: *intermittent networking*
 - *Mission-specific architecture and API*
 - *Multiple layers of network intermittency*

ICT4B Application Areas

- E-Government
 - Forms, status updates, certifications
- Health
 - Early screening
- Trade
 - Price dissemination, market making
- Education
 - Various topics: health, agriculture, microfinance, etc.
- Alerts / News / Weather
- General communication

ICT4B Technology Areas

- Task-Specific Devices
 - Hand-held with speech recognition
 - Local wireless
 - Sensors
 - Uses: Medical, data entry, information, etc.
- Intermittent Networking
 - DTN forms the underlying networking technology
 - Capable of supporting async messaging over most any comms technology
- Distributed System Architecture
 - Back-end services in data center (databases, trading system, etc.)
 - Village-level kiosks (cache, I/O capability with devices, printer)
- Speech Recognition
 - Speaker-independent small-vocabulary approach
 - (currently taking samples in Tamil)
- Very Low Cost Displays
 - Using ink-jet printing approach

Some of The Team...[7/2004]

MSSRF (Villianur) ...[7/2004]

MSSRF (Kizhur?)...[7/2004]

MSSRF (Veerampattinam) ...[7/2004]

ICT4B Project Status

- ICT4B NSF ITR funded 10/2003 (5yr)
- DTN forwarding layer and early apps being tested (code released 3/2003)
- Joint UCB/Intel attendance at 'ICT for Sustainable Development' conference Jan 2004/Bangalore; 'Bridging the Divide' conference Mar 2004/Berkeley; 'Digital Rally' Apr 2004/San Jose; PolicyMaker's Workshop July 2004/Delhi
- Fellow travelers: HP Labs India, IIT Bombay/Kanpur/Madras, Univ. of Washington, MITRE, DARPA, NSF, CMU, UCLA, JPL, U Waterloo, MCI
